

# MANAGEMENT AND COST ACCOUNTING

7TH EDITION

## Standard costing and variance analysis

Use with Management and Cost Accounting 7e  
by Colin Drury ISBN 9781844805662

### Definition

- **Standard costs** (expected cost) are **target costs** for each operation that can be built up to produce **a product standard cost**.
- A budget relates to the cost for the total activity, whereas **standard** relates to **a cost per unit of activity**.
- As a result there are almost always **differences between the actual costs and the standard costs**, and those differences are known as **variances**.

### Operation of a standard costing system

1. *Most suited to a series of common or repetitive organizations (this can result in the production of many different products).*

Respons- ibility centre	Operation no. and standard cost No.	£	Products							Total standard cost £	Actual cost
			100	101	102	103	104	105	106		
A	1	20	✓	✓		✓	✓	✓	✓	120	
B	2	30		✓		✓		✓		90	
C	3	40	✓		✓		✓			120	
D	4	50	✓	✓	✓				✓	200	
Standard product cost			£110	£100	£90	£50	£60	£50	£70	£30

by Colin Drury ISBN 9781844805662  
© 2008 Colin Drury

2. *Variances are traced to responsibility centres (not products).*
3. *Actual product costs are not required.*
4. *Comparisons after the event provide information for corrective action or highlight the need to revise the standards.*

### Establishing cost standards

1. Two approaches:
  - (i) past historical records
  - (ii) engineering studies
2. Engineering studies
 

A detailed study of each operation is undertaken:

  - direct material standards (standard quantity × standard prices)
  - direct labour standards (standard quantity × standard prices)
  - overhead standards:
    - cannot be directly observed and studied and traced to units of output;
    - analysed into fixed and variable elements;
    - fixed tend not to be controllable in the short term.

### Standard hours produced

- Used to measure output where more than one product is produced.

#### Example

Standard (target) times: X = 5 hours, Y = 2 hours, Z = 3 hours  
 Output = 100 units of X, 200 units of Y, 300 units of Z  
 Standard hours produced =  $(100 \times 5 \text{ hours}) + (200 \times 2 \text{ hours}) + (300 \times 3 \text{ hours}) = 1\,800 \text{ hours}$

- If actual Direct Labour Hours are less than 1 800 the department will be efficient, whereas if hours exceed 1 800 the department will be inefficient.

### Purposes of standard costing

- To provide a prediction of future costs that can be used for decision-making.
- To provide a challenging target that individuals are motivated to achieve.
- To assist in setting budgets and evaluating performance.
- To act as a control device by highlighting those activities that do not conform to plan.
- To simplify the task of tracing costs to products for inventory valuation.

### Direct material variances

- Material price variance /SP- standard price, AP- actual price, AQ- actual quantity/

- $(SP - AP) \times AQ$   
 $(£10 - £11) \times 19\,000 = £19\,000 \text{ (Material A)} \rightarrow \text{adverse}$   
 $(£15 - £14) \times 10\,100 = £10\,100 \text{ (Material B)} \rightarrow \text{favourable}$

- Material usage variance

- $/SQ - \text{standard quantity/}$   
 $(SQ - AQ) \times SP$   
 $(9\,000 \text{ units} \times 2 \text{ kg/unit} = 18\,000 - 19\,000) \times £10 = £10\,000 \text{ (Material A)}$   
 $\rightarrow \text{adverse}$   
 $(9\,000 \text{ units} \times 1 \text{ kg/unit} = 9\,000 - 10\,000) \times £15 = £15\,000 \text{ (Material B)}$   
 $\rightarrow \text{adverse}$

Use with Management and Cost Accounting 7e  
 by Colin Drury ISBN 9781844805662  
 © 2008 Colin Drury

- Joint price/usage variance

- $SQ \times (SP - AP) = 18\,000 \times (10 - 11) = 18\,000 \text{ (Material A)} \rightarrow \text{adverse}$
- $(SQ - AQ) \times (SP - AP) = (19\,000 - 18\,000) \times (10 - 11) = 1\,000 \text{ (Material A)} \rightarrow \text{adverse}$
- Summarize: 19 000 (Material A)  $\rightarrow$  adverse

- Total material variance = SC - AC  
 /SC- standard cost, AC- actual cost/

### Direct labour and overhead variances

- Wage rate variance /SR- standard wage rate, AR- actual wage rate, AH- actual number of hours worked/

- $(SR - AR) \times AH$   
 $(£9 - £9.60) \times 28\,500 = £17\,100 \rightarrow \text{adverse}$

- Labour efficiency variance /SH- standard number of hours worked/

- $(SH - AH) \times SR$   
 $(9\,000 \text{ units} \times 3 \text{ hours/unit} = 27\,000 - 28\,500) \times £9 = £13\,500 \rightarrow \text{adverse}$

Use with Management and Cost Accounting 7e  
 by Colin Drury ISBN 9781844805662  
 © 2008 Colin Drury

- Variable overhead expenditure variance

- Flexed budget allowance  $(AH \times SR) - \text{Actual cost}$   
 $(28\,500 \times £2 = £57\,000) - £52\,000 = £5\,000 \rightarrow \text{favourable}$

- Variable overhead efficiency variance

- $(SH - AH) \times SR$   
 $(9\,000 \text{ units} \times 3 \text{ hours/unit} = 27\,000 - 28\,500) \times £2 = £3\,000$   
 $\rightarrow \text{adverse}$

- Fixed overhead expenditure (spending) variance /BFO- budget fixed overhead, AFO- actual fixed overhead/

- $BFO - AFO$   
 $£120\,000 - £116\,000 = £4\,000 \rightarrow \text{favourable}$

### Sales variances

1. Variances should be computed in terms of contribution profit margins rather than sales revenues.

2. *Example*

Budgeted sales	= 10 000 units × £11/unit	= £110 000
Actual sales	= 12 000 units × £10/unit	= £120 000
Variance in terms of sales value (£110 000 - £120 000)		
		= £10 000 → favourable
Standard and actual cost per unit = £7		
Budgeted contribution profit margin = 10 000 × (11 - 7) = £40 000		
Actual contribution profit margin = 12 000 × (10 - 7) = £36 000		
Variance in terms of contribution profit margin (£40 000 - £36 000)		
		= £4 000 → adverse

Use with *Management and Cost Accounting 7e*  
by Colin Drury ISBN 9781944805662  
© 2008 Colin Drury

3. Objective is to maximize profits (not sales value).

4. Total sales margin variance

<i>Actual contribution profit margin</i>		
• Actual sales (9 000 units × £90/unit)		= £810 000
• Standard variable cost of sales (9 000 units × £68/unit)		= £612 000
		<u>£198 000</u>
<i>Budgeted contribution profit margin: 10 000 units × (£88/unit - £68/unit)</i>		
		= £200 000
Variance		= £2 000 → adverse
